

TABLE OF ALL COMMENTS MADE ON EAGLE EYE VACCINE SURVEY

Can you give an explanation for your answer above? (optional...all responses are anonymous)
I'm worried about any long term side effect that we won't know about because it's so new.
It's the only way to stop the spread
I want to try to keep myself and others around me from getting the virus.
Why would you not do something that can protect your health and the health of your loved ones??
I plan on getting the vaccine in order to do my part to stop the spread of COVID-19.
Have confidence in vaccine, but not on long term effects. Would get if I were older. Current age 36.
Vaccines are a medical advancement that have made a positive impact on our health over the years. The science behind this vaccine is sound, therefore, I will get the vaccine.
Side effects and not enough information on it
By getting vaccinated, I am protecting the most vulnerable people that I encounter regularly.
In my opinion, there has not been enough time to evaluate the long term effects of the vaccine.
Not enough information on long term effects from the vaccine.
I am In the High Risk Categorie and Have had all the vaccines made since childhood and never had a reaction so I will feel safer in the workplace by receiving the vaccine. I am all in!
I believe in science. I want to do my part in stopping this global pandemic. I want to ensure that I'm doing everything possible to keep people safe, especially those I love. Doing my part means wearing masks and social distancing, as well as getting this vaccination. I am healthy enough to receive it, so I feel it is safe. If we want to stop the pandemic and get back to 'normal', we need to use all the tools available...and do our part.
I would opt out unless it would be required for me to continue working.
I trust science, and I feel the sooner we all get vaccinated, we get back to some type of normalcy.
want to make sure the vaccine covers the new strain of covid before getting.
The only way we can get our economy and our lives back to normal is by getting the virus under control and the best hope we have of doing that is the vaccine.
Fast-tracked vaccines have a poor safety record, and there are 2 older, safe drugs being used to treat Covid-19, both of which are highly successful within 48 hours, so why would I risk the unforeseen side effects of a new vaccine? Plus I take Vitamin D/K and zinc daily, all of which help lessen the severity of Covid-19 when one contracts it.
I have family members who are medical researchers. We have had many discussions on the vaccine. As a result, there is no doubt in mind, I want to take the vaccine because the benefits far outweigh the negatives.
I want to help with slowing down the spread of COVID. I also think getting the vaccine will help schools to open up responsibly.
Too early to know how effective it will be and if there will be unexpected side effects
Not enough information on the possible long-term effects
I have not had Covid yet and I'm worried about it. I also want to do my part to help things to go back to normal.
I don't trust any vaccine that is thrown together so quickly. Not enough is known about it yet. I had the virus, so I am not worried about it.

Is it even safe? Is this the government playing games? Infect us all and then provide the cure? \$\$\$\$\$\$\$ There is such contradictory information available that I don't know the right decision!?! Do I see the value of vaccines? Absolutely. Do I trust this one? Absolutely not!

It's the responsible thing to do!

For my safety and my family's safety

I feel that as a teacher, it is important to remain healthy for our students, co-workers, and family members. Let's get this world back to where it needs to be!

I believe the vaccine was created too quickly and there are too many unknowns that go along with it. Also, I have many allergies and it has been recommended that people with allergies do not get the vaccine.

Already received first dose. to help stop the spread and hopefully prevent me from getting the virus.

We need as many people to get vaccinated as we can in order to develop herd immunity. There have been almost no cases of serious side-effects

I am not comfortable getting the vaccine due to the newness of it. Also my family and I do not receive flu shots so even if it was a vaccine that has been around for some time, we would still opt out.

I don't usually get the flu vaccine or any other vaccines offered. I rarely take medications even when I get a headache! I've already had the virus. The vaccine is so new...I will wait for a later version, if I even get it at all.

1. Because Bill Gates is already too rich to resort to a desperate plot to alter the DNA of every red-blooded American.
2. Because the Anti-vax Fringe has watched the average longevity of Americans climb into the 80+ stratosphere from the pit of 60+ range that was typical of the Pre-vaccine Era--and yet vaccines are The Anti-Christ..
3. Because I don't understand how conspiracy theorists who once defended Donald Trump's every move now question the scientific and medical integrity of what is likely to go down in history as his most impressive accomplishment: funding and rolling out the most efficient vaccine program in human history, a program that for all its perceived delays is by far the quickest implementation ever.
4. Because I enjoy nodding my head and going along with the fantasy that COVID is an unprecedented disease. C'mon, it's a bad flu. If you want a real disease, research the 1920 flu--it killed 3% of the entire world population. COVID ain't even close. Will someone pass me the Kool-Aid?
5. Because I'm tired of hearing "uncertain," "unprecedented" and "in these times" every time I turn on a radio or television.
6. Because it may become a condition of my employment.

I don't normally get vaccines, and I am taking numerous precautions to prevent the spread as well as prophylactic measures to ensure my own safety.

My oncologist is unsure of the ways the drugs may interact with the chemo that I received.

I have talked with many different doctors who all are supportive of the vaccine and have provided me with research that supports why they feel it is beneficial and safe. Additionally, they believe that it will be a vaccine that will be similar to the flu shot in the sense of it being annual- so I am not concerned with it having lasting effects such as infertility to DNA morphing since it will likely need to have an annual booster.

Getting the vaccine is the responsible thing to do. If a large enough portion of the population gets the vaccine, then less people that are susceptible to illness or immunocompromised will be in danger.

I want to protect myself, my students and my family. It is also what is best for our country so that we can begin to move back to a more normal life.

We have to trust science and get back to normal again!

To protect those around me as well as myself. I want to get back to normal life!

<p>Would like so immunity being a teacher. I also have family with different autoimmune diseases in my household that I don't want to bring covid home to.</p>
<p>I think it's one step closer to the end goal - herd immunity. I feel it's important to vaccinate to protect myself, but also to protect others. After considering pros and cons, the pros in my mind outweigh the cons. I'm ready for some normalcy.</p>
<p>The faster things get back to normal the better and the vaccine seems to be the most important step towards normalcy.</p>
<p>I am worried about the unknown long term effects the vaccine may cause, so I am taking time to do research</p>
<p>To protect myself and others from becoming sick. The more people getting vaccinated means the greater a success it will be.</p>
<p>Vaccines are historically not safe, but especially when it's production is rushed. Already there have been reactions to it and even deaths. We all know of stories about vaccines gone wrong. Herd immunity is more effective, not a vaccine for every virus that comes along. More importantly, the vaccine isn't about keeping people safe. It is about control. (see Planet Lockdown film coming this month by Catherine Austin Fitts)</p>
<p>Based on medical advice of a healthcare professional, I prefer to receive a particular vaccine. I am unsure if that option will be available in the near future.</p>
<p>I don't trust it there is not enough data to prove it is a safe and effective shot.</p>
<ol style="list-style-type: none"> 1. I have spent an enormous amount of time reading articles from doctors in various teaching hospitals across the United States, and listening to ER docs in various teaching hospitals and in specialty practices, etc. These are docs NOT associated in any way with the development or marketing of any of the vaccines currently approved. They are 100% in favor of the vaccine and cite research that supports their opinion. I'm not a medical professional and in all other matters pertaining to my health, I receive the input of a medical professional to make decisions about my wellness. This is no different. 2. There are millions of people who have received the vaccine. They are fine. 3. I am vaccinated for all other contagions including flu, tetanus, shingles, and childhood immunizations. 4. With information comes knowledge and therefore we do not have to make decisions based on our emotions such as fear.
<p>I hope that life can become more normal again once herd immunity is established.</p>
<p>Personal decision...no real reasons except I don't feel a need to get it at this time.</p>
<p>Nervous because there isn't a lot of testing on this vaccine and lots of people are getting sick from the actual vaccine.</p>
<p>I'm just waiting to see how others respond to the vaccine. I believe vaccines are important, however; I also believe in making sure they are safe. I would rather not be a Guinea pig.</p>
<p>I know many individuals who work in the medical field, and they believe one should receive it.</p>
<p>It is important to serve others in our community and keep our families safe. Getting the vaccine will help the community to be safe and healthy. As individuals, we need to make decisions based on research and science.</p>
<p>I believe in science and the vaccine will help save lives.</p>
<p>Age and Health Issues</p>
<p>Not enough evidence; afraid of side effects that may come about several years later from a product that wasn't tested very long before being administered to the public; I have underlying health problems which I receive medication for...afraid of potential effects of both interacting</p>
<p>If the vaccine will allow me to work and not worry about getting sick- I'll definitely get it. Hey, if it's safe for our new President, it's safe for me too!</p>

Worried about potential side effects

I am hoping that we can return to some form of normalcy once we reach herd immunity, sooner rather than later, which will only happen once at least 70% of the population receive the vaccination.

I'm unaware of the possible side effects for future pregnancies.

In order to defeat this virus, we need to develop "herd immunity." There will be people with health issues that will not be able to get the vaccine; therefore, healthy individuals, like myself, need to step up. Plus, I have total confidence in the research and science that has led to its development.

I want to do my part to help get everything back to normal and be able to go to music festivals and vacation this summer

I have close relatives who have major health conditions and getting the vaccine will give me more piece of mind being around them. It is still very scary.

Receiving this vaccine will not only help to protect myself and my family but my students and friends.. It's the right thing to do, and it could help to make the virus more manageable.

I want to protect my family by protecting myself from the virus. If it helps to prevent the spread, it may save a life! I also want to be able to travel (especially on a plane) freely without worrying about putting myself or others at risk. I hope that it helps our schools get back to normal and that live theater can return. So many people have had their lives and livelihood utterly destroyed by this virus. Gandhi said to "be the change you wish to see in the world." The world is hurting, so getting the vaccine is a small way that I can be the change.

Though I wasn't sure I would get it, now I think it's the best way to return to normal.

To make our community safer. We all share this responsibility!

Have reactions vaccines

I want to be back full in person-if that means me getting vaccinated will help to protect my students and fellow staff, I am more than willing! I also have had Covid and know first hand that the side effects of the vaccine...that we know of....are nothing compared to having Covid and its possible complications.

Not enough research to know the long term effects of the vaccine.

I just think that there has not been enough research time committed to the vaccine. And since COVID does not even present itself in the same way for all people, I find it nearly impossible to create a vaccine to cover all of the symptoms when they don't even know what they all are on a consistent basis.

We need to put the "new normal" to rest and return to "normal." No more shutdowns, quarantines, etc.

Too soon and not enough data, 98% recovery rate if you do get Covid, why poison yourself

My husband is older than 65 and has underlying health issues which puts him in the worst category for getting covid and I want to be able to have children and grandchildren visit without fear of someone spreading it to us

Vaccines are proven to work. I will do my part for my community.

I have several reasons for my choice. I do not believe that the vaccine has been vetted enough. I need to see how it affects the larger populace before I am comfortable. I believe that our bodies were designed in amazing ways, and I do my best to take care of it in order for it to do what it was designed to do. I believe that this virus has been largely politicized and that the vaccine is not necessary for my body to fight this virus.
